

## General Description

Speed control unit designed for two-speeds Leslie speakers ( mod 122.147 .. etc).

Adding this board on the leslie amplifier and a three position switch, you can stop the rotors using the same consolle cable.

The rotors' time of brake can be adjusted by rotating the trimmer on the board (the time can vary from amplifier to amplifier, it depends on the motor's o-ring state of wear ). The low voltage control signal makes the interface more secure than traditional systems and increases the switches life.

## Technical Features

- Speed control with the addition of the stop function, directly from the console.
- Adjustable braking time.
- Low voltage state control, which increases the safety in use and extends switches' life.
- Switching becomes instant and reliable.

## Applications

- Upgrade two speed Leslie in two speed Leslie with “brake” without any cable addition, and directly from the console.
