

HAMMOND ORGANS REVERB KIT

mod. **L'ECO** - rev. 1.0
February 2013

Description

Spring reverb for Hammond organs , designed for both console and spinets. (B3, C3, M3 or any organ that features AO-28 or AO-29 preamp). The ECO is a pure class-A design using all discrete components in the main audio chain. The discrete preamp inside runs at high voltage delivering large audio transient without distortion or dynamic compression. Eco features the original Accutronics™ double spring reverb tank, as in the original Hammond design. Eco was designed for a professional use, so it is extremely affordable. A relay actuated bypass circuit, guarantees a true bypass of the signals in case of lack of power supply, making you able to play without interruptions. An exclusive tube socket design makes the mounting easy, without cable soldering, and completely reversible.

Thecnical data

- *Compatible with all console Hammond organs like B3-C3-A100 series and spinets like M3-M100 series.*
- *Easy to install, without soldering*
- *No mains cable wiring! The whole reverb is powered by the tube socket.*
- *No bottle neck in the audio chain. High voltage design ensures high dynamic!*
- *Original Accutronics™ 2 spring reverb tank as in Hammond design.*
- *Comes with remote potentiometer and mounting plate.*
